S. A. BUSHMIN, V. A. GLEBOVITSKY. THE SCHEME OF MINERAL FACIES
OF METAMORPHIC ROCKS

*Институт геологии и геохронологии докембрия РАН, 199034. Санкт-Петербург, наб. Макарова, 2;
e-mail: bushmin@sb1402.spb.edu*

On the base of original calculated data and published experimental and calculated data on the mineral equilibria there has been created the *P-T* grid of mineral facies of metamorphic rocks, which has preserved the well-known names of facies: greenschist, epidot-amphibolite, amphibolite, granulite, glaucophane-schist, eclogite. To characterize the boundaries between the facies and for more detail division into subfacies according to temperature and pressure there have been used mineral equilibria in metapelites and metabasites.
